The free book "Programming Basics with C#" (https://csharp-book.softuni.org) is a comprehensive entry level computer programming tutorial for absolute beginners that teaches basics of coding (variables and data, conditional statements, loops and methods), logical thinking and problem solving using the C# language. The book comes with free video lessons for each chapter, 150+ practical exercises with an automated online evaluation system (online judge) and solution guidelines for the exercises. The book "Programming Basics with C#" introduces the readers with writing programming code at a beginners level (basic coding skills), working with development environment (IDE), using variables and data, operators and expressions, working with the console (reading input data and printing output), using conditional statements (if, if-else, switch-case), loops (for, while, do-while, foreach) and methods (declaring and calling methods, passing parameters and returning values), as well as algorithmic thinking and solving practical programming problems. This free coding book for beginners is written by a team of developers lead by Dr. Svetlin Nakov (https://nakov.com) who has 25+ years practical software development experience and 15+ years as software development trainer. The free book "Programming Basics with C#" is an official textbook for the "Programming Basics" classes at the Software University (SoftUni), used by tens of thousands of students at the start of their software development education. The book relies on

the "explain by examples" and "learn by doing" approaches to learning the practical coding skills required to become a software engineer. Each chapter provides some concepts, explained as video lesson with lots of code examples, followed by practical exercises involving the use of the new concepts with online evaluation system (online judge). Learners watch the videos, try the sample code and solve the exercises, which come as part of each book chapter. Exercises are given in series with increasing complexity: from quite trivial, though little complicated to highly complicated, requiring more thinking and research in Internet. Most exercises come with detailed hints and guidelines about how to construct a correct solution. This book or coding bootcamp, whatever you want to call it, is designed for absolute beginners who have not yet made their hands dirty with code. However, if you plan to be a web developer, learning a good dynamic programming language, then this book is for you. PHP 7 is custom-made for you to build from simple to complex web application.

It is equivalent to an intensive coding bootcamp for three months designed for Absolute Beginners. PHP developers could enhance their coding skill by following a set of rules. This book will give you enough PHP code to practice, so that you can learn all the basic and advanced function and the language references.After finishing this book I advice you to take the second PHP 7 coding bootcamp, belonging to this series.All you need to do is code everyday from eight to twelve hours using this guide. After two months, you will find, programming in PHP 7 is much easier than before.At the end of the book you will also find a project that will help you to build a dynamic web application.If you are an absolute beginner, then the first few sections may not look very friendly; in fact, you would have a strange feeling, such as, I don't understand anything, or programming is not for me. My advice is, take your time. Here is the real difference with the coding bootcamp you usually attend. They always force you to learn something in a stipulated time, say, three months, or six months. After that, what happens? Sixty percent of the participants just drop out. They cannot take that pressure.You have a freedom to take your time, here. Code everyday, take your rime, and see the difference. Note down your progress. It is designed for two months. You can take three, or four months to complete the whole book. Try to understand the concepts, and be aware of your purpose - why you are learning PHP? To build a web application, isn't it? Then, why don't you try to build a website of your own, using PHP code given here, and try to make it more dynamic? This is your first challenge: create a dynamic website after

fifteen days.

This book will empower computer science and programming students to learn the language basics of Java; so that, they could build applications in Java. It is for the first time that a book with a "problems-solutions-explanations" approach using "Direct Method"; it is like an intensive coding bootcamp where participants will take active part to develop their logical and analytical thinking so that they could solve interactive problems. For that reason, we will get our head around the basics of Data Structures and Algorithm also.We are learning the language basics of Java together to solve many types of problems first. It will help us to build applications that are discussed in the next Java bootcamp series, where we will develop applications.Here, in this first bootcamp, we will start writing code first. If you cannot take a short swim in the pool, you cannot learn swimming. Therefore, we will learn about objects and classes, primitive data types, arrays, logical if-else, switch-case, loop constructs, etc by solving problems.Let us start with small programs, the result follows; since it is caused by some phenomenon, we will learn the theory thereafter. We will study the problem first, then we solve it and practice some more relevant problems. After that we will discuss theory.After all, we want to build many applications with the help of Java, that is our main purpose of learning Java. Although the Abstraction stays behind the curtain, we will learn them with the help of our problems.As we progress, by solving more than 100 problems from simple to complex, we will learn the Java language basics and its related

core concepts, such as Algorithm.

Javascript is a powerful, object-based scripting language;JavaScript programs
can be embedded directly in HTML web pages. When combined with the
Document Object Model (DOM) defined by a web browser, Javascript allows you
to create Dynamic HTML (DHTML) content and interactive client-side web
applications. JavaScript syntax is similar to that of other popular programming
languages such as C, C++ and Java, which makes it easy to learn for
experienced programmers. At the same time, JavaScript is an interpreted
scripting language, providing a flexible, forgiving environment in which new
programmers can learn. There's no need to buy a JavaScript compiler or
interpreter---the JavaScript interpreter is shipped as part of your Internet
Browser.
